User Manual

Flight Briefing Assistant

Version 1.2 · July 2026

FOR REFERENCE ONLY — NOT FOR OPERATIONAL USE

The official hard-copy OFP must be used for flight operations. Individual use only.

Welcome to Sky Matrix

Sky Matrix is a flight-briefing assistant. It reads your OFP, builds a clean briefing, drives an inflight display and nav log, and gives you checklists, cabin announcements and weather — all in one place on your iPad or phone. It runs in your browser and installs as an app (Add to Home Screen).

For reference only — not for operational use.

Always use the official hard-copy OFP for flight operations. Sky Matrix is for individual use only.

1. First time you open the app

Your access code. Each device is licensed by a code locked to that device. Start a free trial (email your Device ID) or subscribe at **skymatrix.biz**, then paste the code on the lock screen and tap **Activate**.

Set a PIN to open the app quickly (and Face ID / fingerprint if offered).

Your details (required). The first time you open the app you must enter your **Full name, Position, Airline** and **Aircraft**. These personalise your announcements and are shared with your administrator.

- Your **name is set once** and cannot be changed later.
- Position, airline and aircraft can be updated any time from **Utilities** → **PA** → “**Edit my saved details.**”

Required to unlock

The app will not open until all four details are filled. Existing users see the same one-time prompt the first time they open the app online after this update.

2. Load an OFP

On the **Load** tab: drop your OFP (PDF or text) or tap to choose, then tap **Sky Matrix AI**.

- **Qatar OFPs** are read instantly by the built-in reader (works offline); when online, Sky Matrix AI also reads the printed nav-log table to enrich the nav log.
- **All other airlines** are read by Sky Matrix AI directly from the OFP page images.
- On **Android**, you can share an OFP straight into Sky Matrix from your email.

The reader keeps improving as more flight plans are read.

3. OFP Briefing

The left rail's **OFP Briefing** has five pages: **OFP** (header, weights, fuel, times), **Route**, **Weather**, **NOTAMs** and **Info**. NOTAMs are colour-coded by time window (red = active now, amber = time-window, green = clear); on the Departure / Arrival NOTAM viewer you can star important ones — they stay marked and sort to the top. The **Info** page gives a plain-language route synthesis for this flight plus the crew list once a roster has been read.

4. Inflight Display

- **Dep** — departure details; tap **Blocks off** to start the block timer.

- **Nav Log** — a **waypoint-by-waypoint** table straight from the OFP: Cum NM, RETA (plan ETA), RFOB (plan fuel), PFL (plan FL). You fill in your **ATA**, **AFOB** and **AFL** as you fly (saved on the device). Tap a waypoint for its OFP detail (lat/long, EET, wind, OAT, ISA dev, MORA, tropopause, airway) and notes. The **D-ATIS / METAR-TAF / NOTAMs** buttons are on the same page.
- **Arr** — arrival details; tap **Blocks on** to stop the block timer.
- **Time** — everything time-related in one place: **In-flight rest**, **flight-time capture** (takeoff START and GPS auto take-off / landing), a **time marker**, and the full **block of times** (elapsed, time-to-go, ETA UTC & local, rest countdowns and sun times).

Weather fallback

METAR / TAF / D-ATIS are fetched live; if a live source is unavailable, Sky Matrix falls back to the METAR / TAF printed in your OFP.

5. Documents

Open **Docs** from the left rail. It has four tabs:

- **OFP** — the OFP document used for the current flight.
- **My Docs** — your own PDFs / images, stored on the device; the PDF viewer shows all pages and expands to full screen.
- **Checklist** — create multiple named checklists shown as tabs (open, reorder, rename, delete). The **Checklist maker** turns any document into steps — review and edit, then **Add to Checklist**.
- **Admin Docs** — documents your administrator pushes appear here and stay until you delete them; tap **Check for new documents** to pull them without reopening the app.

6. Utilities

- **PA** — read the crew from a roster (photo / PDF / Word / text), and write announcements. Your name, position and airline come from your profile. Type blanks as ____ or [brackets] and tap **Sky Matrix AI** to fill them with this flight's data (it also fixes spelling and grammar), then **Save**. Name a script **Welcome** or **Descend** and it is routed to the Departure / Arrival PA and auto-personalised for the current flight. Every saved announcement has a **Sky Matrix AI** button that expands and fills it on the spot.
- **Dangerous Goods** — ICAO emergency-response guidance by hazard class and drill letter.
- **Aircraft Lookup** — look up an ATC callsign or registration via Flightradar24 (needs internet).

7. Version & updates

The PIN screen shows your version (currently **v1.2**) and a **What's new** list. When a new version is published, a banner tells you to close and reopen the app to update.

For administrators

Admin console (admin.html) — enter your admin token, then:

- **Users** — every device with its pilot name / position / airline / aircraft, email, plan and status. The list loads automatically on any device with the token.
- **Grant / block / delete** licences; **Services & billing**; **Reviews**; **Feedback**.
- **Push docs** to one device, a group, or everyone — they land in each pilot's Admin Docs.
- **Name a device** and **assign devices to groups**.
- **Group admins (delegated)** — mint a token for a fleet's own admin; they use **subadmin.html** to see only their group's users, push docs to the group and name group devices (they cannot grant, block or delete).

Licensing

One active device per email. Codes are device-locked and expire on their day.
